

Company Profile

Our company designs and manufactures equipment for the demineralisation of gelatine liquors during production by means of Ion Exchange technology and has achieved considerable success in improving the profitability of companies, which have adopted our processes.

Established in 1977 as a specialist dedicated to the gelatine industry, **ADAMELIA** invented new methods for purifying gelatine and identifying the most commercially advantageous techniques to guarantee continuity of quality. Our installations are spread throughout the World and have enabled our clients to achieve higher profit margins together with consolidation of existing gelatine sales and increased penetration of expanding markets, due to the improved quality of the finished product.

Since our first installation, we have supplied every other ion exchange and associated gelatine purification units in the United Kingdom and United States of America and thus all of the gelatine manufactured in North America is purified using our processes and equipment. Other countries such as India, Germany, Belgium, Holland, China, Australia and Brazil (to name but a few) have adopted our process and all endorse our claim.

Essentially, we have invented a new process technique, which reduces gelatine losses during de-ashing to negligible proportions and reduces environmental waste problems. We also improve the use of chemicals, extend the life of treatment materials and, most importantly, preserve and improve the quality of gelatine as presented to the treatment installation.
